

**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

1. (Currently amended) An enhanced breathing device for use in a mouth of a user and comprising:

a flexible hollow tube comprising a proximal end, a distal end, an outer perimeter, and further comprising:

an extraoral segment extending to the proximal end of the tube and comprising at least one opening, wherein the extraoral segment extends externally from the mouth of the user;

an intraoral segment extending to the distal end of the tube and comprising at least one opening, wherein the intraoral segment extends into the mouth of the user and comprises a length sufficient for extending beyond a retromolar space, into the oropharynx and terminating between the posterior tongue and the soft palate; and

an intermediate segment extending between the extraoral and intraoral segments and comprising a length sufficient for extending along an outside of dentitions of the user and around a rearmost dentition of the user to create a[(the)] buccopharyngeal pathway of the mouth of the user; and

a stop on the [(tube)]intraoral segment to secure the intraoral segment within the oropharynx against movement of the tube out of the mouth of the user.

2. (Original) The enhanced breathing device of claim 1, wherein the stop abuts a rear molar in the mouth of the user.

3. (Original) The enhanced breathing device of claim 1, wherein the stop comprises an outer perimeter that is larger than the retromolar space and the outer perimeter of the tube is smaller than the retromolar space.

4. (Original) The enhanced breathing device of claim 1, wherein the stop is adjustable lengthwise along the tube.

5. (Original) The enhanced breathing device of claim 1, wherein the stop is slidably movable along the outer perimeter of the tube.

6. (Original) The enhanced breathing device of claim 1, further comprising an extension from the outer perimeter of the tube that prevents a distal movement of the stop therepast.

7. (Original) The enhanced breathing device of claim 6, wherein the extension is on the intraoral segment of the tube.

8. (Original) The enhanced breathing device of claim 1, wherein the distal end of the tube is angled to facilitate insertion of the intraoral segment into the retromolar space.

9. (Original) The enhanced breathing device of claim 1, wherein the tube comprises an outer preformed bend having a convex side and an opposite concave side.

10. (Original) The enhanced breathing device of claim 9, wherein the extraoral segment comprises an open end; the intraoral segment comprises an open end and at least one ventilation opening disposed on at least one of the convex side and the concave side of the tube; and the intermediate segment contains at least one ventilation opening disposed on at least one of an upper side between the convex and concave sides of the tube and an opposite lower side of the tube.

11. (Currently amended) ~~The enhanced breathing device of claim 1, further comprising~~ An enhanced breathing device for use in a mouth of a user and comprising:

a flexible hollow tube comprising a proximal end, a distal end, an outer perimeter, and further comprising:

an extraoral segment extending to the proximal end of the tube and comprising at least one opening, wherein the extraoral segment extends externally from the mouth of the user;

an intraoral segment extending to the distal end of the tube and comprising at least one opening, wherein the intraoral segment extends into the mouth of the user and comprises a

length sufficient for extending beyond a retromolar space, into the oropharynx and terminating between the posterior tongue and the soft palate; and

an intermediate segment extending between the extraoral and intraoral segments and comprising a length sufficient for extending along a buccopharyngeal pathway of the mouth of the user;

a stop on the tube to secure the intraoral segment within the oropharynx against movement of the tube out of the mouth of the user; and

a retention diaphragm slidably mounted on the tube for securing the intermediate segment within the user's buccopharyngeal pathway.

12. (Previously Presented) The enhanced breathing device of claim 1, wherein the tube has a preformed outer shape comprising a first portion with a first concave surface and an opposite first convex surface and a second portion with a second convex surface and an opposite second concave surface.

13. (Previously Presented) The enhanced breathing device of claim 1, wherein the stop is formed as a preformed expansion in the tube.

14. (Previously Presented) The enhanced breathing device of claim 1, further comprising an oxygen source comprising an outlet disposed in close proximity to the tube, allowing oxygen to flow from the outlet of the oxygen source to the tube.

15. (Previously Presented) The enhanced breathing device of claim 14, wherein the outlet of the oxygen source is connected to the extraoral segment.

16. (Previously Presented) The enhanced breathing device of claim 14, wherein the tube comprises a connector stem that removably connects to the outlet of the oxygen source.

17. (Previously Presented) The enhanced breathing device of claim 14, wherein an end of the oxygen source is disposed in surrounding relation to the extraoral segment of the tube.

18. (Previously Presented) The enhanced breathing device of claim 14, wherein the outlet of the oxygen source is connected to a mask that is disposed in surrounding relation to the extraoral segment of the tube.

19. (Original) The enhanced breathing device of claim 1, wherein the extraoral segment comprises an open end and wherein the intraoral segment comprises an open end.

20. (Original) The enhanced breathing device of claim 19, wherein the open end of the intraoral segment is angled starting from an upper side of the tube to a lower side of the tube.

21. (Original) The enhanced breathing device of claim 19, wherein the intraoral segment comprises at least one ventilation opening.

22. (Original) The enhanced breathing device of claim 21, wherein the intermediate segment comprises at least one ventilation opening.

23. (Original) The enhanced breathing device of claim 22, wherein the extraoral segment comprises at least one ventilation opening.

24. (Currently amended) An enhanced breathing device for use in a mouth of a user and comprising:

a flexible hollow tube comprising a proximal end, a distal end, an outer perimeter, and further comprising:

an extraoral segment extending to the proximal end of the tube and comprising at least one opening, wherein the extraoral segment extends externally from the mouth of the user;

an intraoral segment extending to the distal end of the tube and comprising at least one opening, wherein the intraoral segment extends into the mouth of the user and comprises a length sufficient for extending beyond a retromolar space, into the oropharynx and terminating between the posterior tongue and the soft palate; and

an intermediate segment extending between the extraoral and intraoral segments and comprising a length sufficient for extending along an outside of dentitions of the user and

around a rearmost dentition of the user to create a[[the]] buccopharyngeal pathway of the mouth of the user; [[and]]

an oxygen source comprising an outlet disposed in close proximity to the tube, allowing oxygen to flow from the outlet of the oxygen source to the tube; and

a stop on the intraoral segment to secure the intraoral segment within the oropharynx against movement of the tube out of the mouth of the user.

25. (Previously Presented) The enhanced breathing device of claim 24, wherein the outlet of the oxygen source is connected to the extraoral segment.

26. (Previously Presented) The enhanced breathing device of claim 24, wherein the tube comprises a connector stem that removably connects to the outlet of the oxygen source.

27. (Previously Presented) The enhanced breathing device of claim 24, wherein an end of the oxygen source is disposed in surrounding relation to the extraoral segment of the tube.

28. (Previously Presented) The enhanced breathing device of claim 24, wherein the outlet of the oxygen source is connected to a mask that is disposed in surrounding relation to the extraoral segment of the tube.

29. (Previously Presented) The enhanced breathing device of claim 24, further comprising a stop on the tube to abut a rear molar in the mouth of the user to secure the intraoral segment within the oropharynx against movement of the tube out of the mouth of the user.

30. (Previously Presented) The enhanced breathing device of claim 24, wherein the distal end of the tube is angled to facilitate insertion of the intraoral segment into the retromolar space.

31. (Previously Presented) The enhanced breathing device of claim 24, wherein the tube comprises an outer preformed bend having a convex side and an opposite concave side.

32. (Previously Presented) The enhanced breathing device of claim 31, wherein the extraoral segment comprises an open end; the intraoral segment comprises an open end and at least one ventilation opening disposed on at least one of the convex side and the concave side of the tube; and the intermediate segment contains at least one ventilation opening disposed on at least one of an upper side between the convex and concave sides of the tube and an opposite lower side of the tube.

33. (Previously Presented) The enhanced breathing device of claim 29, wherein the stop extends beyond an adjacent periphery of the tube and is not movable.

34. (Currently amended) A method of creating a buccopharyngeal airway in a mouth of a user, the method comprising:

providing a flexible hollow tube having a proximal end and a distal end;

positioning an extraoral segment of the tube, which extends to the proximal end of the tube and has at least one opening, exterior to the mouth of the user;

positioning an intraoral segment of the tube, which extends to the distal end of the tube and has at least one opening, beyond a retromolar space in the mouth of the user, into the oropharynx and terminating between the posterior tongue and the soft palate; and

positioning an intermediate segment of the tube, which extends between the extraoral and intraoral segments, along an outside of dentitions of the user and around a rearmost dentition of the user to create the buccopharyngeal pathway of the mouth of the user.

35. (Original) The method of claim 34, further comprising securing the intraoral segment within the oropharynx.

36. (Original) The method of claim 35, wherein securing the intraoral segment within the oropharynx comprises positioning a stop in abutment with a rear molar in the mouth of the user.

37. (Original) The method of claim 34, further comprising separating at least a portion of the posterior tongue from the soft palate of the user.

38. (Original) The method of claim 37, wherein separating at least a portion of the posterior tongue from the soft palate of the user comprises positioning at least a portion of the intraoral segment between the posterior tongue and the soft palate.

39. (Original) The method of claim 34, further comprising providing an oxygen source that delivers oxygen to the tube.

40. (Original) The method of claim 39, further comprising positioning an outlet of the oxygen source in close proximity to the tube to allow oxygen to flow from the outlet of the oxygen source to the tube.

41. (Original) The method of claim 40, further comprising connecting the outlet of the oxygen source to the extraoral segment of the tube.

42. (Original) The method of claim 40, further comprising providing a connector stem on the tube and connecting the outlet of the oxygen source to the connector stem.

43. (Original) The method of claim 39, further comprising positioning an end of the oxygen source in surrounding relation to the extraoral segment of the tube.

44. (Original) The method of claim 39, further comprising connecting the oxygen source to a mask and disposing the mask in surrounding relation to the extraoral segment of the tube.

45. (Previously Presented) The enhanced breathing device of claim 24, wherein the enhanced breathing device is a medical device that enhances the breathing of the user during a medical procedure.

46. (Previously Presented) The enhanced breathing device of claim 1, wherein the enhanced breathing device is an anti-snoring device.

**Appln No. 10/816,566**  
**Amdt date April 4, 2008**  
**Reply to Office action of January 7, 2008**

47. (Previously Presented) The method of claim 34, wherein the creating a buccopharyngeal airway in the mouth of the user enhances the breathing of the user during a medical procedure.

48. (Previously Presented) The method of claim 34, wherein the creating a buccopharyngeal airway in the mouth of the user is used during sleep of the user to enhance breathing of the user to reduce snoring.

49. (Previously Presented) The enhanced breathing device of claim 1, wherein the stop extends beyond an adjacent periphery of the tube.

50. (Previously Presented) The enhanced breathing device of claim 49, wherein the stop is not movable along the tube.

51. (Previously Presented) The enhanced breathing device of claim 50, wherein the tube comprises an outer preformed bend having a convex side and an opposite concave side, wherein the stop is at least partially on the concave side.

52. (New) The enhanced breathing device of claim 9, wherein the intermediate segment comprises an additional preformed bend adjacent to the stop and to a junction between the intermediate segment and the intraoral segment.

53. (New) The enhances breathing device of claim 52, wherein the additional preformed bend is bent at an angle between approximately 65 degrees and 135 degrees.
